

CaliBol®Original

Dietetic calcium bolus for reduction of the risk of milk fever

CaliBol is a fast releasing bolus, containing a combination of calcium chloride, calcium propionate and magnesium, which together effectively reduces the risk of milk fever after calving.

CaliBol contains:

- Calcium chloride optimizes the calcium blood level in the short term
- Calcium propionate supports calcium blood level for several hours
- Magnesium contributes to a higher level of mobilization of calcium in the blood after calving

Benefits and effect:

- Dissolves in the rumen within 25 minutes
- Provides 40 grams of easy absorbable calcium
- Provides sufficient calcium in the blood after calving
- Minimizes the risk of mistakes – the cow gets the intended

CaliBol is covered by EU and US patent

Packaging:

- 4 pcs. per zip lock bag
- 20 pcs. per case
- 6 cases per box

Application:

1st bolus: Immediately after calving.

2nd bolus: 10-14 hours after calving.
High-risk cows may be supplemented with CaliBol 24 hours before calving and 24 hours after calving

It is recommended that a nutritional expert's opinion be sought before use.

After treatment at calcium infusion:

1st bolus: 2 hours after calcium infusion

2nd bolus: 12 hours after calcium infusion

Consumption:

2-4 boluses per cow in the period around calving
